## REPORT OF THE SUPERINTENDENT OF THE CENSUS.

Census Ofrice, Wasumgiton, December 1, 1851.

Sir : I have the honor to report that fill and complete returns of the Seventh Census have been received from all the States of the Union on this side of the Rocky mountains, and from the Territories of New Mexico and Oregon. A portion of the California returns were destroyed by the conflagration at San Francisco-an accident which rendered it necessary for the census agent to prepare new copies from the originals, which are expected bere daily. The other returns have been rueiven.
On the 30 th September there were employed in this office nincty-one clerks, two messengers, two watchmen and two latorers. In the month of November it was found necessary, in order to prepare certain information in time for the meeting of Congress, to make a large temporary addition to the clerical force of the ollice, and the number was increased to one hundref and forty-eight, who have performed extra duty.
The frequent demands made by State officers and private individuals fo statistical information, has much increased our labors. All such calls hav been promptly responded to, when compliance therewith would not interfere too much with the progress of business.
The schedules used in taking the Seventh Census of the United States were arranged on principles different from any heretofore used for that purpose. The plan alopted for their construction, while adding inmensely to the labor of the office, presents, on the face of the scherlule, much more information in the same space, and a better combination of facts relating to persons and things than has heretofore been attained, while it is perfectly simple, without complication, but little liable to error, furnishing easy means of detecting and correcting most of the errors which occur. These blanks were prepared under the direction of the Census Board, and were furnished in timely season. They proved to be well adapted to the purpose for which they were designed. Among the great number transmitted through the mails from every portion of our territory, not one schedule wag received at the office in a mutilated condition, or in any way injured.

The expenses of the Census Offiee have been as follows, viz:
For printing and stationary, including the amount reported at the first and second sessions of the last Congress, andby the Census Board.\$33,153 71
For amount paid United States marshals. ..... 34,001 25
For amount paid to assistant marshals ..... 891,245 18
For amount paid for clerk hire and contingent expenses of the office- ..... 105,929 66
The aggregate amount appropriated for taking the Seventh Census was ..... 1,267,500 00
The balarce on hand this first day of December, $1851 \ldots .$. ..... 203,170 00
The balance due to marshals and assistant marshals of the United States ..... 130,20100
To pay our contingent expenses, including clerk hire, office rent, fuel, stationary, etc., to the 30th day of June, 1853, there will be required an appropriation of one hundred and fifty thousand dollars ..... 150,00000

The cost of printing the compilation of the Seventh Census forms no portion of this estimate-that must be determined by the plan adopted by Congress for the extecution of the wark.

In the few cases where payment has not been made to marshals and their assistants in full, their accounts have been delayed, either on account of -negligence in making a proper or timely return of their work, or to admit of some firther consideration, in cases where the question of amount is, under the act of Congress, to be fixed ly the Secretary of the Interior, and the data still too imperfect to enable him to decide the matter, without, perlaps, doing injustice to the parties themselves, or the Government.

To such marshals as the act of Congress authorizes the payment of "a reasonable anount for clerk hire, provided the charges under the act for taking the census do not reach $\$ 500$," the principle has been adopted, to pay in no case a larger amount than that which, added to the other charges of the marstal, will make his gross receipt equal to that sum. This construction of the act of Congress is believed to be in accorlance with its intention.

The compensation of sone of the assistant marshals, particularly in remote regions of the United States and Territories, which are not included within the provisions of the supplementary act of August 30, 1850, is entirely inallequate to the amount of duty performed. It is my opinion that additional compensation is equally due to some of the marshals.

To the marshals and assistants, with but few excep**ons, too much credit cannot be accorde:l for the prompt and efficient manner in which they have discharged the duties preserilend by the law, and for the readiness with which they have responded to calls for information on a variety of subjects, some of which were not enbraced in the schedules. To them is die the credit of returns being made and rendered from this widely-extended country, in time to admit of placing the aggregate enumeration of population before the Congress succeeding that which enacted the law, and on the first day of its session. The zeal and industry of many of these officers have contributed to furnish materials, rich and various, illustrative of the history, geography and geology of the country, and it would be gratifying to the superintendent of the census to be permitted to send to each marshal and assistant, who has thus respected the calls upon his time and labor, a copy of that census which their united exertion have contributed to enhance in value. Good results would, doublless, be experienced in future years from liberality thus dispensed.

When it is renembered that previous to the date of its commencement, eight days only elapsed after the passage of the act to take the seventh census, and, considering the large increase of population, and the immense. extent of new territory comprised within its scope, it is not to be supposed that this office can be charged with delinquency; in view of the fact that we have received all the returns from every portion of the country, (excepting those accidentally destroyed in California, ) within a shorter time than they were received after the commencement of the sixth census, for the taking of which the law was enacted fifteen months previous, which gave ample time for executing the preparatory measures.
In the performance of the present work, there have been engaged forty. five marshal and 3,231 assistants; to each of whom, in addition to the schedules, were sent pamphlets of printed instructions, together with "form" schedules ready filled up for their guidance.

Payment has been made to the officers in :wo portions-the first, on the receipt of the marshal's certificate that the assistant had made proper returns to his office; and the second; after an examination of every item of the work in detail by this office, and adding to or abating the amount certified to be his due, as the result justified. The entire number of payments made to marshals and assistants has been 5,959 . In sorne cases the assistant has preferred to receive payment at one time, after the final exannination of his returns.
In the compilation of the seventh census, it has not been deemed necessary to divide the population (as has been done heretofore) into divisions other than by counties, cities, wards or boroaghs. Lath county of the United States possesses a copy of its own returns, and for its own purposes it enjoys facilities of arriving at the interests of the separate towns or towa-ships-divisions uninteresting to the community at large. Each separate State possesses also a copy of the complete returns of the whole State, and from these may be able easily to subdivide, for State purposes, as minutely as desirable. To include all the subdivisions of each State would make the work, if not now, very soon, entirely too unwieldy. The suldivisions are, however, laid down in the original returns, and if it should be deemed desirable, snay easily be designated in the genera! work.
The original returns should be carefully preserved, and should, as heretofore, be bound for their better preservation. It seemed to ne doubtful whether the office possessed the authority to expend more in the preservation of these valuable records, than would secure them from injury while in actual use for preparing the census. The only expense incurred tor this purpose has been for book boards, which can be used for binding them.
Duty to coming generations requires that documents containing so many proofs relating to the history of the present, should be carefully guarded from injury or harm. While they contain the last record of the dead for one year, they comprise no insignificant portion of the history of every man, woman and child living; and long after all those whose names they contain will have passed from earth, will they be appealed to in proof of our once having lived, for our place of residence, our children, and our property. Those now living use them to learn whether friends or relatives long unheard of may not be found, and the search is not always made in vain; they have led to the diss:overy of lost relations, and their developments have brought happiness to many families.
It would be well worth the expense to have reccrded in volumes, alphabetically arranged, the name of every adult citizen or head of a family, as it appears in the return, with his occupation, and with a reference to the schedule upon which it may be found. This would furnish facilities of search hercafter, and save unnecessary handling of the papers. The advantages of such a plan would be somewhat analogous to that in practical operation in England, with respect to the registration of their deaths, births and marriages. Names to the number of $14,000,000$ have there been registered during the past twelve years, in the ordinary course of events, in one office alone. The returns are rendered the more valuable for future reference by the incessant vigilance exercised to the detection of etrors.

The utmost care has been exercised to insure correct returrs, and the manner of taking our census bas been calculated to effect such a result. In connection with every variety of statistics given, the name of each per
son to whom every entry on the tables applies has been furnished. In all cases where error or inconsistency could be detected, real or imaginary, the individual has been written to, in order that the discrepancy might be corrected. The replies have been, for the most part, prompt and satisfactory. It has been necessary in only three cases to call the attention of an United States distriet attorney to require enforcement of the act of Congress for refusal to reply to the interrogations of the assistants. In all but one of these cases return has been eventually made without the necessity of making costs to the parties-in that excepted, the individual paid costs before appeazance, and made satisfactory return to the office. These facts speak loully in favor of the general intelligence of our people, and their deference to the laws, and prove that as liberty and intelligence are diffused, these investigations, inale for the benefit of the people, cease to be deened inquisitorial. Here no fears of an excise duty or tax deters individuals from contributing to a stock of knowledge, the dissomination of which must lead to the benefit of all.

The seventh enumeration of the irhabitants of the United States exhibits rest:ts which erery citizen of the comntry may contemplate with gratification and pride. Since the census of 18t0, there have been adtled to the teritory of the republic, by annexation, conquest and purchase, $8: 33,970$ square miles; and our title to a region covering 341,463 square miles, which before properly belonged to us, but was clamed and partally occupied by a ferecgn power, has been established by negotiation, and it has been brought within our acknowledged boundaries. By such means the area of the jinted States has been extended, during the past ten years, from $2,0.5,1(63$ to $3,220,572$ square mikes, without including the great lakes which lie upon our northern border, or the bays which iadent our Atlantic and Pacific shores; all of which has come within the seope of the seventh census.
In the condearor to ascertain the progress of our pmpulation since 1840, it will be proper to deduct from the aggregate number of inhabitants shown by the present consus, the population of Texas in 1840, and the number embraced within the limits of Califomia and the new Territories, at the time of their acquisition. From the best information which has come to hand, it is believed that Texas contained, in 1440, 75,000 inhabitants; and that when California, New Mexico and Oregon came into our possession, in 1846, they had a population of 97,000 . It thus appears that we have received, by accessions of territory since 1840, an accession of 172,000 to the number of our people.

The increase which has taken place in those extended regions, since they came under the authority of our government, should obviously be reckoned as a part of the development and progress of our population; nor is it necessary to complicate the comparison by taking into account the probable natural increase of this acquired population, because we have not the means of determining the rate of its advancement, nor the law which governed its progress, while yet beyond the infuence of our political system. The year 1840, rather than the date of the annexation of Texas, has been taken for estimating her population, in connection with that of the Union, because it may safely be assumed that, whatever the increase during the five intervening years may have been, it was mainly, if not altogether, derived from the United States.

Owing to delays and difficulties mentioned in completing the work, which no action on the part of this office could obviate, some of the returns from California have not yet been received. Assuming the population of California to be 165,000 , (which we do partly by estirnate, the total number of inhabitants in the United States was, on the 1st of June, 1850, 23,263,488. The absolute increase from the 1 st of June, 1840, has been $6,194,035$, and the actual increase per cent. is 36.28 . But it has been shown that the probable amount of population. acquired by additions of territory should be deducted in making a comparison between the results of the present and the last census. These reductions diminish the total population of the country, as a basis of comparison, to $29,091,488$, and the increase to $6,022,035$. The relative increase, after this allowance, is found to be 35.27 per cent. The aggregate number of whites in 1850 was $19,630,738$, exhibiting a gain upon the number of the same class in 1840 of $5,434,933$, and a relative increase of 38.28 per cent. But excluding the 153,000 free population supposed to have been acquired by the addition of territory since 18.10, the gain is $5,281,933$, and the increase per cent. is $: 37.20$.

The number of slaves, by the present census, is $3,204,087$, which shows an increase of 716,733 , equal to 28.81 per cent. If we deduct 19,000 for the probable slave population of Tevas in 1340, the result of the comparison will be slightly diferent. The absolute increase will be 697,733, and the rate per cent. 98.05.
The number of free colorerl in 1850, was 428,(661; in 1840, $386,232$. The increase of this class has been 4,969 , or 10.96 per cent.
From 1830 to 18.10 , the increase of the whole population was at the rate of 32.67 per cent. At the sume rate of advancement, the absolute gain for the ten years last past would have been $5,576,540$, or 445,445 less than it has heen, without influding the inerease consequent upon additions of territory.
The aggregate increase of population, from all sources, shows a relative advance greater than that of any other decennial term, except that from the second to the third census, during which time the country rereived an accession of inhabitants by the purchase of Louisima, considerably greater than one per cent. of the whole number. Rejecting from the census of $1810,1.45$ per cent. for the population of Louisiana, and from the census of 1850 one per cent. for that of Texas, California, \&cr., the result is in favor of the last ten years by about one-lourteenth of one per cent.; the gain from 1800 to 1810 being 35 per cent. and from 1840 to 1850, 35.28 per cent. . But, without going behind the sum of the returns, it uppears that the increase from the second to the third census was thirty-two hundredths of one per cent. greater than the increase from the sixth to the seventh.

The decennial increase of the most favored portions of Europe is less than one and a half per cent. per annum, while with the United States it is at the rate of three and a half per cent. According to our past progress, viewed in connection with that of European nations, the propulation of the United States in forty years will exceed that of England, France; Spain, Portugal, Sweden and Switzerland combined.
The relative progress of the several races and classes of the population is shown in the following tabular statement:

Inerease pent. of each class of inhabitants in the United sutten jor sixty years.

| Olasses. | $\int_{\text {d }}^{1790} 180$ | 1800 to 1810. | $\begin{aligned} & 1810 \text { to } \\ & 1820 . \end{aligned}$ | $\begin{gathered} 1820 \text { to } \\ 1830 . \end{gathered}$ | $\begin{gathered} 1830 \text { to } \\ 1840 \text {. } \end{gathered}$ | $\begin{aligned} & 1840 \text { to } \\ & 1850 . \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Whites | 35.7 | 36.2 | 34.19 | 83.95 | 34.7 | 88,24 |
| Fyeécolored. | 82.2 | 72.2 | 25.25 | 36.85 | 20.9 | 10.08 |
| Slavos. . . . . . | 27.9 | 38.4 | 29.1 | 30.61 | 23.8 | 28;8 |
| Tptal colored. | 32.2 | 37.6 | 28.68 | 31.44 | 28.4 | 28.45 |
| Total popalation | 35.01 | 36.45 | 38.12 | 38.48 | 32.67 | 36.4 |

The census had been taken previously to 1830 on the 1st of Augustif the enumeration began that year on the 1st of June, two months earlier, 89k that the interval between the fourth and fifth census was two months leex than ten years, which time allowed for would bring the total increase up to the rate of 34.36 per cent.

The table given below shows the increase from 1790 to 1850 , without reference to intervening periods:

Sixty years since, the proportion between the whites and blacks, bond and free, was 4.18 to 1 . In 18.50, it was 5.4 to 1 , and the ratio in favor of the former race is increasing. Had the blacks increased as fast as the whites during these sixty years, their number, on the first of June, would have been 4,686,410; so that, in comparison with the whites, they have lost, in this period, 1,053,660.

This disparity is much more than accounted for by European emigration to the United States. Dr. Chickering, in an essay upon emigration, published at Boston in 1848-distinguished for great elaborateness of research -estimates the gain of the white population, from this source, at 3,922,1520 No reliable record was kept of the number of emigrants in the United States until 1820, when, by the law of March, 1819, the collectors were required to make quarterly returns of foreign passengers arriving in theing districts. For the first ten years, the returns under the law afford unaterials for only an approximation to a true state of the facts involved in thig inquiry.

Dr. Chickering assumes, as a result of his investigations, that of the 6,431,038 inhabitants of the United Siates in 1820, 1,430,906 were foreigners arriving subsequent to 1790, or the descendants of such. According to Dr. Seybert, an earlier writer upon statistics, the number of foreign passengers, from 1790 to 1810, was, as nearly as could beascertained,

180,000; and from the estimates of Mr. Seybert, and other evidence, the Hon. George Tucker, author of a valuable work on the census of 1840, supposes the number, from 1810 to 1820 , to have been 114,000 . These estimates make, for the thirty years preceding 1820, 234,000.
If we reckon the increase of these emigrants at the average rate of the whole boly of white population during these three decades, they and their descendents, in 1820, would amount to about 360,000 . From 1820 to 1830 there arrived, according to the returns of the custom houses, 135,986 foreign passengers, and from 1830 to 1840, 579,370, making for the twenty years 715,356 . During this period a large number of emigrants from England, Scotland and Ireland came into the United States through Canada. Dr. Chickering estimates the number of such from 1820 to 1830 , at 67,993 ; and from 1830 to 1840 , at 199,130-for the twenty years together, 267,123. During the same time, a considerable number are supposed to have landed at New York with the purpose of pursuing their route to Canada; but it is probable that the number of these was balanced by the omissions in the official returns.
Erom 1840 to 1850, the arrivals of foreign pacsengers, in the ports of the United States, have been as follows:

Within the last ten years there has probably been very little immigration of foreigners into the United States over the Canada frontier, the disposition to take the route by Quebec having yielded to the increased facilities for direct passenger transportation to the cities of the Union; what there has been may, perhaps, be considered as equalled by the number of foreigners passing into Canadia, after landing at New York, many having been drawn thither by the opportunities of employment afforded by the public works of the province. As the heaviest portion of this great influx of immigration took place in the latter half of the decade, it will probably be fair to estimate the natural increase during the term, at twelve per cent., being about one-third, of that of the white population of the country at its commencement.
Taking for granted the substantial correctness of the above estimates, and the accuracy of the returns during the last ten years, the following statement will show the accessions to our population from immigration rom 1790 to 1850:

$$
\begin{array}{lr}
\text { Number of foreigners arriving from } 1790 \text { to } 1810-\ldots . . . . . . . . & 120,000 \\
\text { Natural increase, reckoned in periods of ten years } & 47,560 \\
\text { Number of foreigners arriving from } 1810 \text { to } 1820-\ldots . . . & 114,000
\end{array}
$$

[^0][1] ..... 308
Increase of the above to 1820 ..... 19,000
Increase from 1810 to 1820 of those arriving previous to 1810- ..... 68,450
Total number of immigrants and descendants of immigrants in 1820 ..... 359,010
Number of immigrants arriving from 1820 to 1830 ..... 203,979
Increase of the alonve. ..... 35,728
Increase from 1890 to 1830 of immigrants and descendants of immigrants in the country in 1820 ..... 134,130
Total number of immigrants and descendants of immigrants in the United States in 1830 ..... 732,847
Number of irmorigrants arriving from 1830 to 1840 ..... 778,500
Increase of the above ..... 135,150
Increase from 1830 to 18408 f immigrants and descondants of immigrants in the United States in 1830 ..... 204,445
Total number of immigrants and descendants of immigrants in the United States in 1840 ..... 1,900,942
Number of immigrants arriving from 1840 to 1850 ..... 185,142
Increase of the above at twelve per cent ..... 722,000
Increase from 1840 to 1850 of immigrants and descendai ts of immigrants in the United States in 1840 ..... $4,350,934$
Total number of immigrants into the United States since 1790, and their descendants in 1850
The density of population is a branch of the subject which naturally attracts the attention of the inquirer. The following table bas been pre- pared from the most authentic data accessible to this office:

Table of the area and the number of inhabitants to the square mile in each State and Ter ritory in the Union.

From the location, climate and productions, and the habits and pursuits of their inhabitants, the States of the Union may be properly arranged into the following groups:

|  | Area in square miles. | Population.. | Number of inhabitants to I square mile. |
| :---: | :---: | :---: | :---: |
| Now Lngiand States, (6)........ .............. | 63,272 | 2,728, 106 | 43.11 |
| Midale States, including Maryland, Delaware, and Ohio, ( 6 ). | 151,700 | 8,553,713 | 56.36 |
| Coast planting States, including South Carolina, Georgia, Florida, Alabama, Mississippi, and |  |  |  |
| Louisiana, (0).......................... | 286,077 | 3,557,872 | 12.43 |
| Central slave States: Virginia, North Carolina, Tennessee, Kentucky, Missouri, Arkansas, (6) | 309,210 | 5,167, 276 | 16.71 |
| Northwestern States: Indiana, Illinois, Michigan, Wisconsin, and Iowa, (5). | 250,295 | 2, 784,945 | 10.82 |
| Toxas..........................e. . . . . . . . . . . . | 237,321 | 212,592 | . 88 |
| Callfornia. | 188,982 | 165,000 | . 87 |

.There are points of agreement in the general characteristics of the States combinerl in the foregoing groups, which warrant the mode of arrangement adopted. Maryldad is classed, as heretofore, with the middle States, because its leading interests appear to connect it rather with the commercial and manufacturing section to which it is here assigned than with the purely agricultural States. Ohio is placed in the same connection for nearly similar reasons.
There seems to be a marked propriety for setting off the new agricultural States of the Northwest by themselves, as a preliminary to the comparison of their progress with other portions of the Union. The occupations which give employment to the people of the central range of States south of the line of the Potomac distinguish them to some extent from that division to which we have given the appellation of the coast planting States. In the latter cotton, sugar and rice are the great staples, the cultivation of which is so absorbing as to stamp its impress on the character of the people. The industry of the central States is mow diversified, the surface of the country is more broken, the modes of cultivation are different, and the minuter divisions of labor create more numerous and less accordant interests. So far as Texas is settled its population*closely assimilates with that of the other coast planting States; but it would obviously convey no well-founded idea of the density of population in that section to distribute their people over the vast uninhabited region of Texas. For the same reason, and the additional one of the isolation of her position, California is considered distinct from other States.

Taking the thirty-one States together, their area is $1,486,917$ square miles, and the average number of their inhabitants is 15.54 to the square mile. The total area of the United States is $3,230,572$ square miles, and the average density of population is 7.2 to the square mile.

The areas assigned to those States and Territories in which public lands are situated are doubtless correct, being taken from the reeords of the Leend Office; but as to those attributed to the older States, the same means of veritying their accuracy, or the want of it, do not exist. But care has
been taken to constilt the best local authorities for ascertaining the extent of suiface in thbse Stateg; and as the figures adcpted are found to agree with, or tiffer but slightly from those assumed to be correct at the General Land Office, it is probable they do not vary essentially from the exact trath.
The area of some of the States, as Maryland and Virginia, are stated considerably below the commonly-assumed extent of their territory, which may be accounted for from the supposition that the portions of the surface within their exterio: limits covered by large bodies of water have been subtracted from the aggregate amount. This is known to be the case in regard to Maryland, the superficial extent of which, within the outlines of its boundaries, is 13,959 square miles ; and is deemed probable with reference to Virginia, from the fact that many geographers have given its total area as high as 66,000 square miles.
It appears from the returns that during the year ending on the 1st of June, 1850 , there escaped from their owners one thousand and'eleven slaves, and that during the same neriod fourteen hundred and sixty-seven were manumitted. The number of both classes will appear in the following table :

$$
\text { Manumetted and figitive :laves- } 1850 .
$$

|  | States. | Manumitted. | Jugitives. |
| :---: | :---: | :---: | :---: |
| Delarsare |  | 277 | 28 |
| Maryland . | . $\cdot$ | 493 | 279 |
| Virginia ... | . . . . | 218 | 88 |
| Kentucky . |  | 152 | 96 |
| Tennessee | .... | 45 | 70 |
| North Carolina | . ! | 2. | 64 |
| South Carolina |  | 2 | 18 |
| Goorgia . . . |  | 19 | 89 |
| Florida...... |  | 42 | 18 |
| Alabama. |  | 16 | 29 |
| Missjesippi:. |  | 6 | 41 |
| Louisiana.. |  | 159 | 90 |
| Texar . . . |  | 5 | 29 |
| Arkanage. |  | 1 | 21 |
| Missouri. . |  | 60 | 60 |
|  | . $\cdot$ | 1,467 | 1,011 |

In connexion with this statement, and as affecting the natural increase of the free colored population of the Urited States, it may be proper'to remark that; during the year to which the census applies, the Colonization Society sent five hundred and sixtyotwo colored emigrants to Liberia. - In our calculations respecting the increase of the free colored population, we: have considered that class of persons independent of tiese two causes which respectively swell and diminish their number.

## montainty.

The rstatistics of mortality for the cestsus year represent the number of cleathe:0teurixing within the year as $320 ; 488$, the ratio being as one to 7\%: 6 .
of the living population, or as ten to each 726 of the population. The rate of mortalily in this statement, taken as a whole, seems so much less than that ' 'any portion of Europe, that it must, at present, be received with some c . rree of allowance.

Showis a more critical examination, which time will enable us to exercise, prove the returns of the number of deaths too small, such a result will not affict their value ; for the purgoses of comparison of one portion of the country with another, or cause with effect, the table will possess an interest second to wone other in the work, and the many valuable truths which they will surgest will be found of great practical advantage. Medical men will accord to the Census Board no small meed of credit for the wistom manifeste: 1 in an arrangement which will throw more light on the history of disease in the United Statcs, and present in connection more interesting facts connected therewith, than the united efforts of all scientific men have heretofore arcomplished.

The registration of the amual deaths, as well as of the living, marks an epoch in the history of "life contingencies" in the Unitel States. To trace the effect of the wide range of physical features and natural productions upon the human consititution and faculties, pescints to every reflecting mind an interesting field of research. Likewisc, to investigate the influcnce of montal oceupations and industrial pursuits, and of the wide diversity of climate, foom the highlands of Maine to the everglades of. Florida, upon the persistance and duration of life, is an ohject of permanent importance, not only in a suientific, but in a commercial and mational point of view. For all sum inguries, the returns of 1650 furnish faxities, less satisfictory indee: than would have been given by a permant system of registration, but far superior to those hitherto a a milable.

Among the more inmediate advantages to he lerived from data of this kind, through the medium of life-tables, they would form a basis for the equitable distribution of lifi-interest in estates, pensions and legacirs; they would assign the true valuation of life annuities, assurances, and re:ersions of heritable property, and tend to protect the public from many all adjusted financial schemes founded in ignorence of the true probabilities of life. They would correct a multitule of prejudices and misconceptions resperting the healthiness of the differint locilities, and besides this, form a common standard of reference in all those moral, sanitary and mercantile statistics which have brought to light enost valuable truths and generalizations, and which give promise of still greater benefits in the advancement of civilization.

Wilhout intending to discuss several attempts heretofore made for the construction of life-tables in this country, let it be observed, as is universally admitted, that the ratio of the annual deaths to the contemporary number living at each age, constitutes the implicit element of computation.

An enumeration of the living, or of the deaths only, is insufficient for the purpose, wiales the population is stationary, or due allowance is made for the changes inwrought by births and migration during the whole eentury previous.

The assumption of a stationary population, however, can scarcely be entertained of even the nldest settled parts of the Union. The value and prospects of life, and the influence of climate on longevity, are lost or obscured, both by recent and remote changes. It is within the memory of persons now living, whea most of our large cities were in tbeir infanc.
where forests were standing on grounds since occupied by the busiest marts of trade, and the corn was waving in the wind where now are the most populous streets.
Periods of unusual emigration or exodus have been followed by a temporary decrease, only to reconmence with aumented numbers. But the thief inequality with reference to the present inquiry aibes from the fact that the great mass of cenigrant: are almost exclusively in the prime of life. Traced upon the texture of socisty, as these changes must be, in relative excesses and deficicncies at the scoural ages, the joint statistics of the living and of the ammal deaths affori the coly fasible mole of arriving at the law of mortality, independent of those forner chatges.
A lif-tathle for the State of Maryland has been prepared from a joint comparisoa of the abstracts of the retums of 1850. If comprises a very full interpretation of the laws of vitality, indicated by the datia for the year of the entmmation, which may be regarded as one of average mortality. In the preseat cass the hasatigation relates caclusively to the white population of Xaryland, imerpective of city or country residents, on of the sexes, or of foregn or migmous extraction.
The results and derived tables are specifeed at length in the report on Maryland. From the preliminam table of popalation these giver, it would appear thes the lin: of cqual divisom of the living folls upon the age of twenty; one half of the white pomation betig muler, and the other half above twenty years of age; or, distibuting with reference to three equal parts, one thid of the population are uader thirteen and a half years of age; one thind are iacluded between this, and the age of twenty nime, and the remaning thirl are above tweaty-nine years of ape. With respect to the deathe, the points of equal disision fall upon ages sevemal years younger than in the corresponding distributions of the living.
Forexhibiting the law of mortality for indiviual lives, the data of the census were egrated, and reluced to the simple casc of 10,203 infants born on the same day, and commenciag life simultaneously.
Assuming that like circunstaces will continue to provail during the years to come in this State, which may be regarded as certain, the popmlation will continually be affected by the same rate of mortality. And hence we may salely astinate and prodict, that, of the specified nomber of inlants at the outset of life, 1,213 will perish prematurely in the frat year of existence, and 9,025 , or numbers i:: that proportion, will survive to enter upon the sccood year. A very considerable but decreasing mortality likewise prevails in the second and third years, leaving only. $\mathrm{S}, 183$, or about four-fifths of the original number, to commence upon their fourth year. But after this age the juverile systom acquires more firmness, and a greater degree of the vigor and experience to guard against disease. At the age of twenty-one, 7,134 survive to enter upon a more active and responsible career of life; of whom 0,302 attain to "thirty-five"-the meridian of manhood. Proceeding onward for twenty years, to the age of "fifty-five," only 4,727 , or less than one half the original number, then survive. From this age the numbers are decimated more frequently, and the vacated places of the fallen are occupied by advancing generations, till, having passed the mental and physical changes in the roun.l and mystery of life, so graphically portrayed in the "Scven.Ages" of the dramatist, a few become centenarians, and linger on the verge of life, till virtually, at the age of one buadred and six years, all have closed their carthly existence.

The table for Maryland also comprises the "Expectations of life," or the average numbe: of years which the great mass of the white population live after a given present age. This arragement of the data is justly described as that wnich is of the most interest to society ; for it points out the average number of years in which one member of the community with another participates in the pleasures and cares of life.

An individual, for instance, on attaininer his thirtieth birtheday, has an expectancy of nearly ihirty-five youss. At fifty years of age the lease of time's estate (so to express the idea) is limited to a little more than nineteen years longer. The maximum cxpectation- 52.86 years-is at the age of four in this tabie; in the well-known Carlisle table, it is represented to occur at the age of five; and at six in the Swedish table. The joint expectation for two lives, as in the marriage relation, or the average period during which brith shall be living, may now be determined in like manner, and also for the: or more lives of give: areses.

It has boce marked that tables, properly constructed from sufficient data, never diffe. widely from each other. For this reason, and on account of their hish value, insertion is likewise given in that report to three standand European tables; from no one of which does the Maryland table differ in the comparison so much as they differ among themselves.

Indeed, the duration of life by the Maryland table is found to be almost an exact medium between the British Female Anmuitant's and the Carlisle values, which affords strong proof of accuracy. From these tabular forms for Maryland, the probabilities of life can readily be ascertained in a given ease, with the value of annuities, assurances, aml other reversions dependent upon lives. And when extended to other lacalities, the results will eventualiy puanote ia most inportant national purpose, one which has long been desired-ilot en obtaining a correct estimate of the standard of human life among ditreant classes of population in this country.

Statement of deatis-Continued.

The great amount of labor requisite to the extraction of the returns of agriculture will admit, at this time, of presenting but lipited accounts, though, gerhaps to some extent, of the most important separate interests.

The returns of the wheal crop for many of the western States will not at all indicate the average crop of those States. This is especially the case with Ohio, Indiana, and Illinois, from which, especially the former, the assistant marshals return a "short crop," to the extent of fifty per cent. throughout the whole State. The shortness of the wheat crop in Ohio, in 1849 , is verified by returns made during the subsequent season, by authority of the legislature. The causes which affected the wheat crop in those States were not without their infuence in reducing that of Western Virginia and Western Pennsylvania to some considerable extent.

## m. Sisfaterans. $^{2}$

The period which has elapsed since the receipt of the : m arns has been so short, as to enable the office to make but a general report of the facts relating to a few of the most important manufactures. If, in some instances, the amount of "capital invested" in any branch of manufacture should seem too small, it must be borne in mind that where the product is of several kinds, the capital invested not being divisible is connected with the product of greatest consequence. This to some extent reduces the capital invested in the manufactufe of bar-iron, in such establishments where some other article of wrought-iron predominates-sheet iron, for example. The aggregate, however, of the capital invested in the various branches of wrought-iron, will, it is confidently believed, be found correct.

The ontire capital invested in the various mamfactures in the United States, on the 1st of June, 1850, not to include any establishments producmg less than the amnual value of $\$ 500$, amounted, in round numbers, to $\ldots . . . . . . . .$. . $8530,000,000^{+}$
Value of raw material ......................................... $500,000,000$
Amount paid for labor-....................................... $2410,000,000$
Value of manufactured articles-................................ $1,0: 0,300,000$.
Number of persons employed-............................... $1,0.50,000$.
More minute particulars respecting these scparate interests will be fourd incorporated in tables A, B, C, D, E, F, G.

## the press.

The statisties of the newspaper press form an interesting feature in the seventh census.

It appears that the whole number of newspapers and periodicals in the United Sates, on the 1st day of June, 1850, amsunted to 2,800 . Of these, 2,494 were fully returned, 234 hal all the facts excepting circulation given, and 72 are estimated for California, the Tervitories, and for those that may have been omitted by the assistamt marshals.

From calculations made on the statistics returned, and estimated circulations where they have been omitted, it appears that the aggregate circnlation of these 2,800 papers and periodicals is abnut $5,000,000$, and that the entire number of copies printed annt ally in the United States amounts to 422,600,000.

The following table will show the number of daily, weekly, monthly ${ }_{r}$ and other issues, with the aggregate circulation of each class:

|  | No. | Circulation. | No. of copies printed abmually. |
| :---: | :---: | :---: | :---: |
| Dailier. | 350 | 750, 0\%0 | 285, 000, 000 |
| Tri-wecklies | 150 | 75,000 | 11,700,000 |
| Semi-weeklies | 125 | 80,0010 | 8,320,000 |
| Weeklies | 2,000 | 2,875, 010 | 144,500,090 |
| Semi-monthlics | 60 | 804, 010 | 7,200, 000 |
| Monthlies | 100 | 900, о-1 | 10,800,200 |
| Quarterlies. | 25 | 28,000 | 80,000 |
| , | 2,800 | 6,000,000 | 422,600,000 |

Four hundred and twenty-four papers are issueil in the New Bngland' States, 876 in the Middle States, 716 in the Southern States, and 784 in the Western States.

The average circulation of papers in the United States, is 1,785 . There is one publication for every $\boldsymbol{7}, 161$ free inhabitants in the United States and Territories.

In accordance with the views expressed in the commission with which the department honored me in May last, I visited, during the three summer
months, the capitals of many of the important governments of - Eurnpe, for the purpose of examining into the methods adopted for the procuring and classification of such facts as are enumerated by those governments in their statistical investigations, in order that our own census might, when published, prove of the greatest value to ourselves, and not seem inferior to those of countries which have the credit of having paid more attention to statistical science, although they may not have made greater advances in what we esteem rational forms of government.
It seems more desirable to possess every ray of light on this subject, when considering that the present census is one of unexampled importance to ourselves and our posterity, as exhibiting our condition to the middle of a century, and illustrative of the progress of a people flourishing beyond all precedent under a new form of government; one whose history and example must, as it becomes known, exert an inportant influence throughout the civilized world: 'This census, while it exhibits our progress for sisty years, with a. precision and certaiaty which no other country has been able to enjoy, and giving a reality to the past, unattainable with respect to any other people,
 country embracing more than a million of square miles of territory, the future destiny of which is inseparably connected with that of the original thitpen States. Not only, however, in connection with these statistical inrestigations did it seem desirahle to a a ail ourselves of any improvements introduced into the censuses of Europe, to enable us to prepare our own great ationa' work on the best system; but for many of the praction purposes to which statistics are applied and deemed valuable, it seemed eqirahle to effect some arrangement by which the publication of the remits of the great clementary facts among nations should be made as nearly simultaneous as possible, and classified on the same gen ral principles, as far as the facts taken would justify, in order that, while re use every exertion to analyze society at home, we may, from heir statistics, enjoy the advantage of being able to arrive at a similar analysis with respect to other nations; and that, while contemplating our 0 wn progress from time to time, we may be able to institute comparisons with the advancement of other people. Heretofore, at almost every step of investigation, the statist, wishing to prosecute inquiries respecting diferent nations touching the great elements of society, has met with the inssrmountable difficulty arising from the different elements elucidated and the diverse methods of combination adopted, which lessen the value of their labors reciprocally, and, in the absence of more reliable data, lead to the frequent use of one set of elements to ascertain the condition of some different set, producing results equally unsatisfactory to the man of science, as they are often dangerous, if made the basis of the political economy and legislation of a government.
In addition to the effort to effect a general sympathy or concert of action among nations, with reference to their periodical statistics, it has been my aim, in which I have succeeded, often in the absence of published records, to procure a knowledge of the exact condition of the people of all classes in each country visited, and learn their true state, with reference to numbers, and the products of their agriculture and manufactures, their social and moral condition, the state of education, the price of labor, and the practical management of the farming interests; in no case, however, relying upon information not either obtained from personal observation, or deFived officilly, and in a manher which can leave no doubt of its correct
ness. My opportunities abroad will not only enable me to effect valuable improvements in compiling our census, but it will be my aim to make the statistical facts useful to the country, by forming them into a report to be supplemental hereto, the completion of which has been retarded by my other oficial duties.
Another object had in view, was the procuring information with reference to the manner in which the various offices in Europe, especially those connected with agriculture and statistics, are organized, and the mamner in which the information obtained is made available to the government and people. To the attainment of these purposes, the few weeks to which my time limited me, and the diversity of languages among those with whom my investigations were pursued, interposed dificulties only surmounted by a zealous determination to effect the duty undertaken-one in which failure raust have ensued, were it not for the official character sustained in connection with the office here, and that with which the department honored me, as its representative abroad; the one enabling me to impart as much valuable information to others as was solicited in return; the other giving facilities \% intcrcourse and a claim to consideration which was never slighted by any officer of a foreign government.

In Fingland, in addition to the free intercourse enjoyed with the officers of government connected with statistical matiers, several opportunitics were offered for bringing the object of my mission before public audiences; and invitations were tendered me to address the members of the London Statistical Socijotat it annual mecting in that city, the Society of Actuaries at Richmone the the British Association at Ipswich, during its annual meeting, which was attended by Prince Albert, one of its members, and many of the most distinguished literary and scientific gentlemen of Great Britain and the Continent. The Statistical Council of Belgium, M. Quetelet, President, gave me a place in their board at one of its regular meetings. On each opportunity it gave me pleasure to present a full account of the character and extent of our inv stigations, under the act of Congress, for taking the seventh Census, to makt a fair and impartial exhibit of our progress in wealth and numbers during the past ten years, and it the same time urge the propriety of mutual efforts twwards the attainment of more uniform and useful statistical publications by different governments. The propriety of this measure was felt by indiviluals who had made statistics a study, and the necessity for some action was universally conceded; and it affords me infinite gratification to state that an arrangement has been made for a general statistical Congress, to be held at Brussels, (Belgium,) during the ensuing fall-a measure which has received the approbation of several of the most distinguished statists of Europe, and from which the most beneficial results are anticipated.

Mr. Porter, of the Board of Trade, has been appointed a delegate to this Statistical Congress from England. He is a gentleman distinguished, no less by his laborious researches and valuable contributions to the science of political economy and statistical knowledge of the British empire, than for the elevated position he holds as a public officer and man of letters.

In:order that Congress may judge of the proptiety of the plan in cono templation for preparing thie tables of the population and other statistics,
and be fully advised of any new features introduced to cher portions of the work, it has been deemed proper to prepare, in printc:! form, the statistics of one State, of which copies will be laill before the members of both Houses for their inspection. For this purpose the State of Maryland has been selected, as best adapted, from its central position and conbination of more of the various elements which enter into our interests, than any other State of its limited extent.

It has been my endeavor, according to the act, to arrange the facts "in the hest and most convenient manner for use." To judge of the character of a statistical work in manuscript would require the long, laborious, and perhaps unsatisfactory investigation of a congressional committee, and Congress would be possessed of no means of forming an indepenlent opinion of the matter. It bas been deemed the more proper to lay before Congress a printed copy, inasmuch as the expense of the entire work may readily be known and some standard of excellence in execution ciearly and intelligibly understood.
The variations of the plan heretofore adopted in the compilation of the decennial census, with every portion of which the facilities of comparison are maintained, consist :

1. In the form-that adopted being, in conformity with the size and appearance of the "American Archives."
2. In accompanying the statistics of each State with a condensed account of the most impertant events connected with its history, from its first settlement ; exhibiting the progress of our whole social system to the year 1850; also, in presenting short accounts of each separate county, from the date of its settlement, with the date of its organization; an account of its physical features, its rocks, minerals, streams, timber; water, and adaptation, naturally and artificilly, to the purposes of agriculture, manufactures, and commerce.
3. In the general geological account of the State.
4. In the account of its progress in population, from the first to the seventh census, inclusive, with tables of population, to make which correctly, it has been necessary to refer to the original returns of the census twenty and thirty years back, as reliance could not be placed on the figures officially given in the printed work.
5. In the review of its character for the health and longevity of its inhabitants, an account of the prevailing diseases and rates of mortality, with full tables, presenting a perfect history of the statistivo of disease and mortality, and calculations of the value of life among the seral classes.
6. In the number of new subjects embraced in the statistical details and in the manuer of classification, so as to admit of extracting all the essential facts respecting the raw materials of each variety if manufactures, together with other features, on which the statist will perceive variations from any previous census.

Allusion is not made to these things with the view to represent their advantages, or as predicating any argument for their adoption. The plan, with all the disadvantages which must result from the sudden formation of a department for its execution, is the result of much study and reflection, and, it is thought, will prove useful. Should the work be found to possess real value, the result must be attributed mainly to the abundant materials collected, and the zeal and intelligence of the persons employed thereon, some of whom are men whose ability should secure a better remuneration, which, it is hoped, Congress will be willing to aecord. If, however, the
general plan shall be considered falty, or by its inperfect execcution be deemed unworthy of adoption, it will have been well thus to bring it to the test, that it may be conderned.

The work, of course, has not been submitted to the public for its judgment; but where opinions have been at all expressed by those deemed geod authority, on the proprety of our classifications, they have been invariably favorable. Some such have found their way into the public documents. In the thirty-second annual report of the New York Institution for the Deaf and Dumb, made to the legislature of that State, the following language occurs, with respect to our designed classification of such portions of the work as interested particularly the directors of that institution: "Such a list will furnish valuable materials, never possessed to any extent before, for solving many highly interesting statistical questions; and its publication is looked for with much interest. We shall endeavor in our next annual report, to set forth the results of a careful amalysis of the eensus returns respecting the deaf and dumb."

So far as the judgment of the public press is concerned, its expression has been much more favorable than cowld be wished with its imperfect knowledge of the plan, as expectations may thereby be mised which the results will not justify. None of the information, as imparted in the volume of statistics, has been promulgated, it being considered indelicate to make known to the world information due first to the head of the department, and through him to Congress; and it would not be decorous to forestall the dispassionate judgment of either.
It has seemed to me that a work, the expense of which is slared by the whole communty, should be arranged, as far as possible, for general utility, and not a compiation of more columns of figures, interesting only to the man of science for legrislative purposes or for refirence, but should be so adapted that while it will furmilh practical information to the statesman and philosopher, and useful data to the legislator, it will contain, also, matters interesting to every portion of the community, furnished somewhat in advante of those deductions from amalytical investigations made years after is publication. To this end, if supported hy the favorable opinion of Congress, it will be made to evolve all of instruction which zealous efforts, though limited ability, are capable of eliciting from the facts within $\cdots$. period of time as it must be aceomplished without retardiag its publication.

It may be contended by some that the gazetteers furnish most of the information we include. 'los such it may he replied, that whilst these publications possess great value, and are all replete with instruction, many present but a reprint of former editions, with the title page changed to suit the date, and a few unimportant alterations in other respects. Others may contend that the plan presented takes within its scope subjects not legitimately embraced within that of statistics. Such an opinion might be maintained by forming conclusions from our previous publicitions; but they are, however, at variance with the best authority on this subiect. The definition of "statistics," as given by one author, consists in "such a description of a country, or any part, as gives the present or actual state thereof." But as it is only by a thorough knowledge of the present state of the country and its inhabitants, with their custons, habits, morals, health, and manners of life, that we can form an accurate estimate of the condition of the people, so to enjoy the knowledge necessary for the amelioration of their circum-
stances, or improve their condition, it is necessary to take a retrospective glance, and study their past history, and trace it to its first beginnings, as we survey a river to its source to acquire a knowledre of its reography or of the permanent character of its supplies.

The term "census" applies more particalarly to wealth and possessions than to numbers. It was so understood by the Romans, who first used the term. Livy, in his first book of the history of Rome, chapter [2, speaking of Servius Tullius, says:
"He then entered on the improvement of the civil polity of the ntuost importance, for he instituted the census-an ordinance of the most salutary consequence in our empire, that was to rise to such a jitch of greatness, and according to which the several contributions in peace and war were to be discharged, not by every person indiscriminately, as formerly, but according to the proportion of their several properties."

And after describing the contributions required in proportion to the wealth of individuals, who appeared on a certain day every year, each in his own century, and give in the amount of his property, he continues: "In all these instances, the burden was taken off the poor, and lail on the rich."

The census was completed with great ceremonies and offering uf sacrifices, termed closing the lustrum. In his fourth book he spenks of a "survey" under the census, and a description of all the lands and houses, and the entire revenue of the Roman people, (B. C. 440.) In the twelfth book, it is stated that "the Senate then received the survey of twelve colonies, presented by the censors of those colonies." Tacitus inentions that Augustus, wrote with his own hand an exact account of his dominions, which is termed a "census." Although the term "census" in our ("onstitution is limited to, and contemplates a bare enumeration of inhabitants, suci. construction does not apply to the act of Congress under which this office is organized, "An act for taking the seventh and subsequent Censuses," $\mathbf{N c}$., the body of the act referring to the collention of statisiies. But it is, perhaps, unnecessary to go back to antiquity for the meaning of the term census, or that of statistics, when we have such good molern authority not only as to the meaning of the terms, but the practical carrying into effect what the most distinguished statists understand to be comprised within their meaning. The term "statistics" originated in England, with Sir Jolin Sinclair, with respect to which, in the twentieth volume of his statistical account oi Seotland, he remarks: "Many people were at first surprised at my using the new words, statistics and statistical. The idea I annex to the terte is an inquiry into the state of a country for the purpose of ascertaining the quancum of happiness enjoyed by its inhabitants, and the means of its future improvement." With such an understanding of the term, he applied the title "Statistical Account" to a work, perhaps, of the greatest magnitude, importance, and public utility ever attempted by one individual, devoted to a perfect history of Scotland. Among almost numberless other features. the statistical account of Scotland contains the ancient and modern names of each parish, its history, extent and nature of the soil and surface, extent and description of sea-coast, lakes, rivers, islands, hills, rocks, caves and woods, the climate, diseases, longevity, state of the church, manse and glebe, the minerals, mineral springs, eminent men, antiquities, parochial records, with an account of the manners, habits and customs of the people.

The collection of the materials occupied seven years and seven months, and their compilation engaged the attention of nine hundred learned men, and fill twenty volumes. Its publication led to a parliamentary survey of England and Wales on somewhat similar principles. "If similar surveys," remarked the founder of British statistics, " were instituted in the cther kingdoms of Europe, it might be the means of establishing on sure foundations the principles of that most important of all sciences, viz: political or statistical philosophy-the science which in preference to any other ought to be held in reverence. No science," he continues, "can furnish to any mind capable of recciving useful information, so much real entertainment; none can yield such important hints for the improvement of agriculsure, for the extension of our commercial industry, for regulating the conduct of individuals, or for extending the prosperity of the State; none can tend so much to promote the general happiness of the species."

The example of all enlightened Europe sustains the views of. Sinclair, although falling far, very far behind him in the extent embraced within their periodical statistics.

McCullough, in the introductory chapter to the last edition of "Smith's Wealth of Nations," uses the following language: "Tu arrive at a true knowledge of the laws which regulate the production, distribution, and consumption of national wealth, we must draw our materials from a very wide surface-study man in every different situation-resort to the history of society, arts, commerce, and government, to the works of philosophers and travellers, to everything, in short, fitted to throw light on the progress of opulence and civilization. We should mark the successive changes which have taken place in the fortunes and condition of the different ranks and orders of men in our own country and in others; should trace the rise, progress, and decline of population and industry ; and above all, should anafyze and compare the influence of different institutions and regulations, and carefully discriminate the various eircumstances wherein advancing and declining societies difier from each other. These investigations are so very complex and difficult, that it is not possible, perhaps, always to arrive at a right conclusion. But though they may not be quite free from error, they are sufficient, when made with the requisite care and attention, to unfold the principhl sources of mational opulence and refinement, and of poverty and deyradation; and however lefective, they furnish the only available means for sutisfactorily solving the various problems in the science of wealth, and for devising a scheme of public administration fitted to insure the advancement of nations in the career of improvement."

The commissioners for the census of Ireland, in 1841, in the introduction to the census of that country, which comprises a folio of nearly one thousand pages, and was published in 1843 , use the following very appropriate language: "We feel, in fact, that a census cught to be a social survey, not a bare enumeration."

In connexion with the population of England, they have published many large, folio volumes, containing maps of all the counties and boroughs in the lingdom. In other portions of Europe the same expanded view is taken of what should constitute a statistical work.

The European statistical publications, in point of execution, far exceed our own, which have heretofore been most inconvenient and unwieldy volumes. The only volumes in its possession which the shelves of the noyal library of Belgium are not adapted to bold, are those of our last cen-
sus, which have occupied a place on the floor, bencath the shelves, for several years. The inconvenient shape of these volumes bas led to their de struction and almost entire extermination. Their extreme rarity at this time leads me to believe that they have, in many instances, unfortunately been used as so much waste paper, not esteemed worth the room they occupied.
These explanations are deemed necessary only for information relating to the views of cotemporancous nations, and not as an apology for what is deemed correct and proper.
Our materials are more varied and of, better character than any nation has ever possessed; and shall it be said, that insensible of their value we have not known how to render them uscful?

Respectfully submitted,
J. C. G. KENNEDY.

Hon. Alex. H. H. Stuart, Sccretary of the Depariment of the Interior.

## CENSUS BOARD.

## Ofrice of the Census Board, Wasmington, December 1, 1851.

The undersigned, Secretary of the Census Board, (constituted by the act of the 3d of March, 1849, and to which cernin duties were assigned by the nineteenth section of the act providing for the seventh and subsequent censuses of the United States, passed the 23d of May, 1850, begs leave respectfully to report, that of the amount appropriated by the act of the 3d of March, 184, an unexpended halance was transferred to the treasury of the United States, amouning to 550648.

That the amount paid for blanks, paper and printing under said act of the Bd of March, 1849, entitled "An aet to make arrangements for taking the seventh census"-fiom 20th of June, 1849, to the 23d of May,
 The amount paid from the $93 d$ of May, 1850, to the 31st of December, 1850, under act of the 23 d of May, 1850, appropriating $\$ 150,000$ "for defraying the preliminary expenses
of taking the seventh census';-................................
The amount paid from the 1st of Janury, 1851, up to and in-
cluding the 30 th day of September, 1851 .
18,510 00
$\qquad$
31,429 39
Making the total amount paid under the direction of the Census Board for blanks, papor and printing from the 20th of June, 1849, to include the 30th of September, 1851, thirty-one thousand four hundred and twentynine dollars and thirty-nine cents.

Which is respectfully selbmitted.
Approved:

J. J. Crittenden,
N. K. Hall,

Census Board.
To the Census Board.

[^0]:    - This return includes fiteen months, from July 1, 1845, to 30th of September, 1846.
    $\dagger$ The roport from the State Department for this year, gives 815,833, as the total number of passengers arriving in the United States; but of these 30,028 were citizens of the Atlantic States proceeding to California by sea, and 5,320 natives of the sountry returning from visita abroari. A doduction of 106,879 is masde from tho balance, for that porticen of the year from June 1 to Soptembor 30.

[^1]:    - The population of California is set down at 165,000 as an approximation to the reall population, which may be essentially varied by complete returns. Should the returns vary from our ostimato so far as to reduce the population of California 30,060, South Carolina will be entitled to a member additional, as being noxt above on the hist of fractions. The offcial returns of Colifornia will slightly affect the calculation respecting the aggregate increase of the free population for the year 1850. Ratio of representation, 48,781.
